
BUSINESS CASE: Strategic Product Expansion Partnership

TO: Leadership Team, Bild AI

FROM: Jacob Harder, The Lifecycle Group

DATE: June 22, 2026

SUBJECT: Joint Venture: Expanding Bild AI into the \$17B Facility Condition Assessment (FCA) Market

1. Executive Summary

This proposal outlines a strategic partnership to expand Bild AI's blueprint-parsing and schedule-extraction core engine into the highly lucrative **Facility Condition Assessment (FCA) and Capital Planning vertical**. By merging our domain-specific FCA engineering logic with Bild AI's automated scheduling and text-matching technology, we will launch a new enterprise revenue line. This module **reduces manual field data capture, analytics, and engineering report generation time by 60%** for national engineering firms and institutional property owners.

2. The Market Opportunity: Beyond Pre-Construction

Bild AI currently solves a massive pain point in the pre-construction phase by helping Division 8 estimators increase bid volume by 40% to 50%. However, once a building is constructed, the lifecycle management of those physical assets represents an unmapped, high-margin market:

- **The Post-Construction Labor Trap:** Engineering firms are paid millions to audit existing buildings. However, field engineers spend up to 60% of their billable hours manually compiling field notes, sizing replacement hardware, and formatting Excel sheets.
- **Natural Product Synergy:** Bild AI already excels at reading floor plans, extracting specifications, and tracking changes across versions. We can leverage this exact technology to process *existing* facility conditions rather than just new construction bid packets.

3. Comprehensive Uniformat II Product Scope

While Bild AI has perfected the automation of doors and hardware, a comprehensive FCA requires evaluating all major building elements. Our module scales Bild AI's core schedule extraction and inconsistency catching logic horizontally across all **ASTM Uniformat II**

Classifications:

└─► Element A: Substructure (Foundations, Basements)

└─► Element B: Shell (Superstructure, Exterior, Roofing)

└─► Element C: Interiors (Partitions, Doors, Finishes)

[Bild AI Core Parsing Engine] └─► Element D: Services (HVAC, Plumbing, Fire, Electrical)

└─► Element E: Equipment & Furnishings (Fixed Assets)

└─► Element F: Special Construction (Demolition, Hazards)

└─► Element G: Building Sitework (Paving, Utilities)

Element A: Substructure [3]

- **A10 Foundations & A20 Basement Construction:** Parsing historical structural geotech reports and foundation drawings to identify piling types, slab configurations, and grading specs. The AI flags structural baseline risks and maps them to foundation lifecycle models.

Element B: Shell

- **B10 Superstructure:** Extracting framing schedules (structural steel, cast-in-place concrete, wood trusses) to automate building type classification for insurance and seismic risk reporting.
- **B20 Exterior Enclosure:** Automating takeoffs for exterior walls, windows, and louvers. Field photos of caulking, masonry cracking, or curtainwall seals are matched against drawing specs to predict localized degradation.
- **B30 Roofing:** Reading roofing plans to extract insulation values, membrane specs (EPDM, TPO, Built-Up), and flashing details, cross-referencing them with manufacturer warranties.

Element C: Interiors

- **C10 Interior Construction & C20 Staircases:** Extracting interior partition schedules, drywall specs, and acoustic ratings.
- **C30 Interior Finishes:** Automatically quantifying flooring (carpet, VCT, tile) and ceiling types from finish schedules. The system maps square footage directly to wear-and-tear replacement lifecycles.
- *Note: This instantly ingests and enhances Bild AI's existing Division 8 door, frame, and hardware schedule capabilities.*

Element D: Services

- **D10 Conveying:** Extracting elevator (hydraulic vs. traction) and escalator schedules, speed ratings, and controller types from MEP drawings to track code compliance.
- **D20 Plumbing:** Parsing plumbing riser diagrams to instantly identify pipe materials (copper, PVC, cast iron), fixture counts, and water heating capacities.
- **D30 HVAC (Mechanical):** Ingesting complex mechanical schedules (chillers, RTUs, boilers, AHUs, pumps). Field photos of nameplates are instantly OCR-matched to blueprint locations to calculate remaining useful life (RUL) via ASHRAE tables.
- **D40 Fire Protection:** Quantifying sprinkler heads, fire pumps, dry-pipe valves, and standpipe configurations directly from life-safety plans.
- **D50 Electrical:** Automatically parsing single-line diagrams to map switchboards, panelboards, transformers, emergency generators, and lighting controls, capturing electrical capacity layouts instantly.

Element E: Equipment & Furnishings

- **E10 Equipment & E20 Furnishings:** Extracting fixed institutional assets (commercial kitchen hoods, laboratory equipment, theater seating, hospital headwalls) to isolate specialized capital asset categories.

Element F: Special Construction & Demolition [4]

- **F10 Special Construction & F20 Selective Demolition:** Scanning historical building records for hazardous material boundaries (asbestos, lead abatement zones) and specialized cleanroom structures.

Element G: Building Sitework

- **G10 Site Preparation to G90 Total Sitework:** Quantifying exterior site assets from civil drawings, including asphalt parking lots (square yardage), concrete sidewalks, perimeter fencing, stormwater retention ponds, and site lighting.
-

4. Workflow Synergy & Value-Based Pricing

FCA consulting firms operate on strict contract budgets. The FCA market supports high-value enterprise SaaS pricing because the labor cost savings are easy to quantify:

ERP & Estimating Software Integrations

Just as Bild AI seamlessly pushes data straight into industry-standard software like **Comsense**, our expanded FCA platform ensures engineers never have to double-enter data:

- **Capital Planning Platforms:** Direct data pushes into **VFA (Gordian)**, **AssetWorks**, and **eGordian** to populate Facility Condition Index (FCI) models instantly.
- **Enterprise ERPs & Costing Engines:** Automated formatting to pipe local equipment replacement costs directly into **RSMeans** and corporate ERPs like **Deltak Vantagepoint**.

The Financial ROI

- **The ROI:** A 60% time reduction saves roughly **720 hours of manual report labor per field engineer annually**. At a fully loaded engineering cost of \$65/hour, our software saves a firm **\$46,800 per user, per year**.
- **Target Enterprise Pricing:** We recommend a value-based tier of **\$300 to \$600 per user, per month** for regional engineering groups, scaling up to specialized enterprise software packages for national firms.

5. Immediate Go-To-Market Plan (Targeted Pilots)

To eliminate market risk and bypass long enterprise sales cycles, we have immediate pilot access to three prominent engineering firms ready to test the software on active public contracts:

1. **MENG Analysis:** Ready to deploy the prototype on upcoming public K-12 school campus assessments in the Pacific Northwest to compress report-writing backlogs.
2. **McKinstry:** Highly interested in testing the HVAC/MEP extraction features to accelerate their energy-retrofitting and decarbonization master planning audits.
3. **Bureau Veritas:** Targeted for a high-volume trial to evaluate how the software handles massive, multi-site commercial portfolio data standardizations.

6. Proposed Collaboration Structure

To minimize operational distraction from Bild AI's core software roadmap, we propose a partitioned joint-venture framework:

- **Our Responsibility:** Provide the direct FCA Unifomat II data structures, localized cost-book integration parameters, and direct sales relationships with the pilot engineering firms.
 - **Bild AI's Responsibility:** Provide access to the core blueprint parsing text-extraction APIs, UI framework, and backend cross-referencing logic.
 - **The Shared Benefit:** A highly scalable, recurring SaaS revenue branch that establishes Bild AI as a leader across both the construction *and* property maintenance phases of a building's lifecycle.
-
